Q 10-13: Read the passage carefully and answer the questions given below :

One of the most hazardous conditions a firefighter will ever encounter is a backdraft (also known as a smoke explosion). A backdraft can occur in the hot-smoldering phase of a fire when burning is incomplete and there is not enough oxygen to sustain the fire. Unburned carbon particles and other flammable products, combined with the intense heat, may cause instantaneous combustion if more oxygen reaches the fire.

Firefighters should be aware of the conditions that indicate the possibility for a backdraft to occur. When there is a lack of oxygen during a fire, the smoke becomes filled with carbon dioxide or carbon monoxide and turns dense gray or black. Other warning signs of a potential backdraft are little or no visible flame, excessive heat, smoke leaving the building in puffs, muffled sounds, and smoke-stained windows.

Proper ventilation will make a backdraft less likely. Opening a room or building at the highest point allows heated gases and smoke to be released gradually. However, suddenly breaking a window or opening a door is a mistake, because it allows oxygen to rush in, causing an explosion.

10. A backdraft is a dangerous condition for firefighters mainly because

- A. there is not enough oxygen for breathing.
- B. the heat is extremely intense.
- C. the smoke is dangerously thick.
- D. an explosion occurs.

- A. carry an oxygen tank.
- B. open a door to allow gases to escape.
- C. make an opening at the top of the building.
- D. break a window to release carbon particles.

13. When compared with a hot, smoldering fire, a fire with visible, high-reaching flames

- A. has more oxygen available for combustion.
- B. has more carbon dioxide available for consumption.
- C. produces more dense gray smoke.
- D. is more to cause a backdraft
